How a prediction is made

Blood expression

17,416 genes (sex−chromosome genes removed)

↓

Centre within chip, standardise

removes batch shifts; no diagnosis used

↓

200 genes x learned weights

chosen and weighted inside training folds

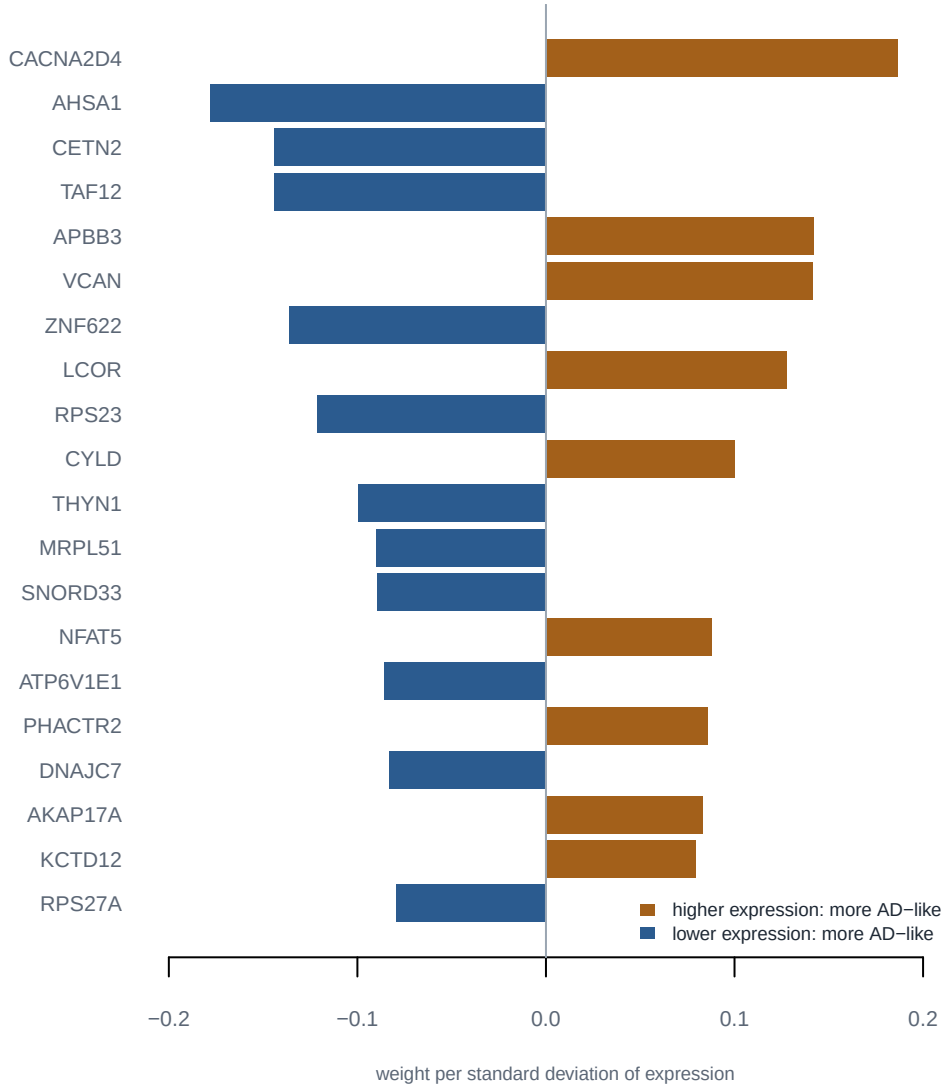
↓

Add up, convert to probability

logistic function, 0 to 1

↓

Probability at least 0.543

output: AD−like pattern


Top 20 of 200 genes by influence
